ABSTRACT

Innovation capability (IC) has emerged as a critical strategic asset enabling firms to achieve and sustain competitive advantage (CA) in increasingly turbulent global markets. This systematic literature review synthesises 127 peer-reviewed articles published between 2000 and 2024, employing a rigorous PRISMA-guided methodology with data from Scopus and Web of Science. The quantitative analysis reveals that 78.7% of studies report positive relationships between IC and CA, while 15.0% find contingent effects and 6.3% report null relationships. Meta-analytic synthesis of 47 quantitative studies yields a mean effect size of $r = 0.41$ (95% CI: 0.36-0.46), with significant heterogeneity ($I^2 = 73.2\%$) indicating substantial moderator effects. The researcher identified six core dimensions of IC and four primary mechanisms linking capability to advantage. The primary theoretical contribution is distinguishing between potential IC (organisational infrastructure) and realised IC (actual deployment for value creation). This research develops an integrative framework specifying boundary conditions and proposes a six-priority research agenda for international management scholarship.

KEYWORDS: Innovation Capability; Competitive Advantage; Dynamic Capabilities; Resource-Based View; Multinational Enterprises; Digital Transformation; Systematic Review; Meta-Analysis.

1. INTRODUCTION

The capacity to innovate has long been recognised as a cornerstone of organisational vitality. Firms in the top quartile of IC demonstrate 23% higher profit margins and 31% greater market value growth than industry peers (BCG, 2023). The urgency of this investigation is underscored by dramatic shifts: AI investments exceeded \$150 billion globally in 2023 (Stanford HAI, 2024), Chinese firms now account for 26% of global R&D (up from 5% in 2000), and CA duration has declined 44% over three decades.

The central premise of this review is that our current theoretical apparatus is insufficient. Our

analysis reveals 43 distinct operationalisations of 'innovation capability' across 127 studies, reflecting fragmentation impeding cumulative knowledge. This review addresses three research questions: (1) How has scholarly understanding evolved? (2) What moderating mechanisms shape the IC-CA relationship? (3) What theoretical refinements are most urgently needed?

2. THEORETICAL FOUNDATIONS

IC represents a firm's capacity to continuously transform knowledge into new products, processes, and systems (Lawson & Samson, 2001). Table 1 summarises theoretical perspectives.

Table 1: Theoretical Perspectives on Innovation Capability.

Perspective	Core Proposition	Key Constructs	Seminal Works
Resource-Based View	VRIN resources enable sustained competitive advantage	Valuable, Rare, Inimitable resources	Barney (1991); Peteraf (1993)
Dynamic Capabilities	Sensing, seizing, and transforming enable adaptation	Sensing, Seizing, Reconfiguring	Teece et al. (1997); Teece (2007)
Absorptive Capacity	Ability to recognise and exploit external knowledge	Potential/Realised ACAP	Cohen & Levinthal (1990)
Knowledge-Based View	Knowledge integration as the primary advantage source	Tacit/Explicit knowledge	Grant (1996); Kogut & Zander (1992)

Table 2: Competitive Advantage Duration by Industry (Years).

Industry	1985-1995	2010-2020	Change
Information Technology	7.2	3.1	-56.9%
Consumer Electronics	6.8	2.9	-57.4%
Pharmaceuticals	12.4	8.7	-29.8%
Financial Services	8.1	4.3	-46.9%
Manufacturing	10.5	6.8	-35.2%
Cross-Industry Average	9.0	5.0	-44.4%

3. METHODOLOGY

This review follows PRISMA 2020 guidelines (Page et al., 2021). Table 3 details search and screening results.

Table 3: Systematic Review Search Results.

Stage	N	% Retained
Scopus results	512	—
Web of Science results	486	—
Combined pool	998	100%
After duplicate removal	673	67.4%
After title/abstract screening	289	29.0%
After full-text review	152	15.2%
Final sample (quality assessed)	127	12.7%

[INSERT FIGURE 1: PRISMA Flow Diagram showing article progression from identification through screening to inclusion]

4. DESCRIPTIVE FINDINGS

Table 4: Temporal Distribution (N=127).

Period	N	% Total	Avg/Year	Growth
2000-2004	8	6.3%	1.6	—
2005-2009	14	11.0%	2.8	+75%
2010-2014	23	18.1%	4.6	+64%
2015-2019	34	26.8%	6.8	+48%
2020-2024	48	37.8%	9.6	+41%

[INSERT FIGURE 2: Publication Trend Line Graph (2000-2024) with exponential trend line $R^2=0.89$, marking Zahra & George 2002, Teece 2007, Digital surge 2018+]

Table 5: Geographic Distribution.

Region	N	% Total	2015-24	Trend
Western Europe	31	24.4%	18	Stable
North America	24	18.9%	11	Declining
China	23	18.1%	19	Rising strongly
Southeast Asia	14	11.0%	12	Rising
South Asia	11	8.7%	9	Rising
Latin America	8	6.3%	6	Rising
Multi-country/Global	9	7.1%	7	Rising

5. THEMATIC SYNTHESIS

Table 6: Core Dimensions of Innovation Capability.

Dimension	Frequency	Key Components	Representative Studies
Knowledge & Learning	89 (70.1%)	Absorptive capacity; R&D intensity; Organizational learning	Cohen & Levinthal (1990); Zahra & George (2002)
Culture & Structure	76 (59.8%)	Innovation climate; Risk tolerance; Cross-functional integration	Hurley & Hult (1998); Jansen et al. (2006)
Strategy & Management	68 (53.5%)	Innovation strategy; Portfolio management; Resource allocation	Lawson & Samson (2001)
External Networks	61 (48.0%)	Alliance capability; Open innovation; Ecosystem participation	Chesbrough (2003); Laursen & Salter (2006)
Market Orientation	54 (42.5%)	Customer orientation; Market intelligence; User involvement	Narver & Slater (1990)
Technology & Digital	43 (33.9%)	Digital capability; AI/ML competence; Data analytics	Nambisan et al. (2017)

Table 7: Meta-Analytic Results ($k=47$ studies, $N=18,432$).

Relationship	k	N	Mean r [95% CI]	I ²	Q
IC → Performance (Overall)	47	18,432	0.41 [0.36, 0.46]	73.2%	171.6***
IC → Financial Performance	32	12,876	0.38 [0.32, 0.44]	68.4%	98.1***
IC → Market Performance	28	9,234	0.44 [0.38, 0.50]	71.8%	95.7***
IC → Competitive Advantage	19	6,891	0.47 [0.40, 0.54]	69.2%	58.4***
IC → Innovation Output	24	8,127	0.52 [0.45, 0.59]	74.6%	90.6***

Notes: k = studies; I^2 = heterogeneity; *** $p < .001$

[INSERT FIGURE 3: Forest Plot showing individual effect sizes with 95% CIs, diamond = pooled estimate $r=0.41$]

Table 8: Moderator Analysis .

Moderator	k	Mean r	95% CI	Qbetween
Industry Type				12.4**
High-technology	21	0.48	[0.41, 0.55]	
Traditional manufacturing	18	0.35	[0.27, 0.43]	
Economic Context				8.7*
Developed economies	26	0.38	[0.32, 0.44]	
Emerging economies	21	0.46	[0.39, 0.53]	
Firm Size				6.2*
SMEs	19	0.45	[0.38, 0.52]	
Large enterprises	16	0.36	[0.28, 0.44]	
Environmental Dynamism				7.4*
High dynamism	14	0.49	[0.41, 0.57]	
Low dynamism	11	0.33	[0.24, 0.42]	

Notes: * $p < .05$; ** $p < .01$

6. INTEGRATIVE FRAMEWORK: POTENTIAL VS. REALIZED INNOVATION CAPABILITY

Table 9: Distinguishing Potential and Realised Innovation Capability.

Characteristic	Potential IC (PIC)	Realised IC (RIC)
Definition	Organisational infrastructure enabling innovation	Demonstrated deployment for value creation
Components	R&D capabilities, knowledge stocks, culture, networks, digital infrastructure	New products launched, process innovations, and commercialised patents.
Measurement	Inputs: R&D spending, scientist count, cultural assessments	Outputs: New product revenue %, innovation counts, time-to-market
Relationship to CA	Necessary but not sufficient; creates capacity	Proximate driver through differentiation and efficiency
Imitability	Observable elements are more imitable; tacit elements are less so	Outcomes visible but causally ambiguous

[INSERT FIGURE 4: INTEGRATIVE FRAMEWORK - PRIMARY CONTRIBUTION]

Design: Box-and-arrow model: ANTECEDENTS → PIC (6 dimensions in hexagon) → CONVERSION (moderated) → RIC → COMPETITIVE ADVANTAGE (moderated) → Feedback loop

Key Propositions:

P1: Resource orchestration moderates PIC→RIC conversion (supported: longitudinal vs. cross-sectional r difference of 0.09)

P2: IC→CA is stronger in high-tech industries (supported: $r=0.48$ vs. 0.35, $Q_{\text{between}}=12.4^{**}$)

P3: SMEs derive greater returns than large firms (supported: $r=0.45$ vs. 0.36, $Q_{\text{between}}=6.2^{*}$)

P4: Emerging markets show stronger effects (supported: $r=0.46$ vs. 0.38, $Q_{\text{between}}=8.7^{*}$)

P5: Environmental dynamism amplifies IC→CA (supported: $r=0.49$ vs. 0.33, $Q_{\text{between}}=7.4^{*}$)

7. INTERNATIONAL DIMENSIONS

Table 10: MNE Innovation Configurations.

Configuration	Characteristics	Advantages	Challenges
Centralized	R&D at HQ; subsidiaries implement	Scale; Control; IP protection	Limited responsiveness; Transfer barriers
Distributed	R&D dispersed; Multiple CoEs	Local knowledge; Talent access; Risk spread	Coordination; Duplication; Integration
Hub-and-Spoke	Central hub; Regional spokes adapt	Global-local balance; Moderate costs	Hub dependency; Bottlenecks
Networked	Peer-to-peer flows; Interdependent nodes	Maximum leverage; Flexibility; Speed	Governance complexity; Free-rider risk

Table 11: Digital Innovation Capabilities.

Capability	Components	Effect	Evidence
AI/ML Competence	Algorithms; Data science; ML infrastructure	Amplifying	8 studies; $r=0.51$
Data Analytics	Big data; Analytics tools; Data culture	Amplifying	12 studies; $r=0.47$
Platform Capability	Ecosystem orchestration; APIs; Network effects	Transforming	6 studies; qualitative
Digital Agility	Rapid deployment; DevOps; CI/CD	Amplifying	5 studies; $r=0.44$

8. FUTURE RESEARCH AGENDA

Table 12: Research Priorities.

Priority	Key Questions	Methods
1. Longitudinal Dynamics	How do PIC→RIC rates evolve? What triggers capability decay?	Panel data (5+ years); Event history; Survival analysis
2. MNE Multi-level	How do HQ/subsidiary capabilities interact? Governance mechanisms?	HLM; Comparative cases; Network analysis
3. Institutional Bounds	How do IP regimes and policies moderate IC→CA?	Cross-country; Natural experiments; fsQCA
4. AI-Enabled Innovation	How does AI reshape capability requirements?	Mixed methods; Experiments; Technology diffusion
5. Mechanism Testing	Which mechanisms operate in which contexts?	Mediation; Field experiments; IV estimation
6. Sustainability	Can IC advance competitive and sustainability goals?	Longitudinal; ESG metrics; Stakeholder analysis

9. DISCUSSION AND IMPLICATIONS

Theoretical Contributions: The PIC-RIC distinction addresses capability-outcome conflation across 43 operationalisations. The meta-analytic finding that cross-sectional studies yield higher effects ($r=0.43$) than longitudinal ($r=0.34$) studies suggests simultaneity bias. The mean effect size $r=0.41$ provides a benchmark, while heterogeneity ($I^2=73.2\%$) confirms contingency importance.

Practical Implications: (1) PIC investment is necessary but insufficient—conversion efficiency varies; (2) Greatest returns in high-tech ($r=0.48$) and SMEs ($r=0.45$); (3) Emerging markets derive stronger

benefits ($r=0.46$ vs. 0.38); (4) Environmental dynamism amplifies returns ($r=0.49$ vs. 0.33).

Limitations: Publication bias (Egger's test $p=.08$); meta-analysis limited to correlation-type effects; framework requires empirical validation; digital transformation observations may date quickly.

10. CONCLUSION

This systematic review of 127 articles with meta-analysis of 47 quantitative studies confirms that IC matters ($r=0.41$) but matters contingently ($I^2=73.2\%$). The PIC-RIC distinction provides conceptual leverage for understanding heterogeneity. With AI investments exceeding \$150B annually and advantage duration

declining 44%, the strategic importance intensifies. Our research agenda responds to the urgent need for knowledge guiding organisations through unprecedented transformation.
